

# Identity-Flow

## Diagram Explanation

This diagram illustrates how identities are authenticated and authorized using Microsoft Entra ID and how access is securely provided to resources.

### 1. Internet

- All users, devices, and apps start their request from anywhere on the internet.

### 2. Authentication

- The request is sent to Microsoft Entra ID for authentication.
- Credentials are verified to confirm the identity of the user or device.

### 3. Entra ID

- Microsoft Entra ID is the identity provider.
- It validates identities and acts as the central authority for access management.

### 4. Conditional Access

- Conditional Access policies are evaluated.
- Factors such as user, device, location, risk, and application are checked before access is granted.

### 5. Identity Services

(Authentication & Authorization)

- Entra ID provides identity services that include both authentication and authorization.

### 6. Resources

- Once access is granted, users, devices, and applications can securely access the resources they are permitted to use.
- Access is governed, protected, and continuously evaluated based on policies, device compliance, user risk, and contextual signals.

## Key Takeaway

Identity is the new security perimeter. Access given based on verification, context, and policy.
